

How do I know my lamps are functioning normally?

FACTS about HID and FLUORESCENT LAMPS:

- It may take HID or T5 fluorescent 10-15 minutes to come to full brightness.
- HID: During the first few hours of use, the light from the lamp will oscillate.
- HID: The light will decrease in intensity during the life of the lamp. This will vary by brand & type.
- HID: During the first hours, intensity of the light may fluctuate somewhat, which is normal. However after it reaches 100 hours of "burn in" time, will continue evenly the remainder of it's life (with normal aging reduction).
- Both: Average life of a MH (metal halide) lamp is 12,000 hours for a 1000 watt lamp and 20,000 hours for a 400 watt lamp. Most users choose to replace lamps before they cease to operate due to lumen loss and spectral shift. T5 fluorescent lamps offer a rated hour life of 20,000 hours and have a much slower lumen loss and spectral shift than HID lamps.

POWER USAGE:

On average a light system will increase your electricity cost from \$8 to \$12 per month — the exact amount depends on the size of the system and the number of hours operated. However, since these lights are so energy efficient, you are getting huge amounts of light for your money! Make sure your power circuit can handle the power draw. For safety reasons, do not exceed 75% of the rated ability of the fuse/breaker (for example: use no more than 15 amps on a 20 amp circuit). To calculate your cost, multiply the bulb wattage X hours of operation and divide by 1000. This figure is the number of kilowatt hours of electricity consumed. (Example: a 400 watt bulb running for 18 hours will use 7.2 kilowatt hours). Check your power bill for the cost of each kilowatt hour. Then multiply the number of kilowatt hours by the cost of a kilowatt hour (K/hr) to arrive at the cost per month to run the light in your area.

Please see the following charts for estimate power costs:

96 watt lighting fixture uses 104 watts per hour.
