Teflon® fabric protector — Repel and Release Technologies.

Attribute

Advanced Dual Action Teflon® fabric protector, the most innovative and effective dual-action repel and release system—combines the best stain fighters into one finish.

Repel Technology Benefits

As a first line of defense, the repel technology offers excellent repellency against both water- and oil-based spills. Repel technology utilizes a finish to form a molecular shield around individual fibers. This lowers the critical surface tension of the fabric to repel liquids, including wine, coffee and oil, and viscous substances, like mustard and ketchup. Liquid spills bead up and roll off. Dry soils can be easily brushed away.

Release Technology Benefits

As a second line of defense, the release technology promotes easier removal of ground-in stains during normal laundering or cleaning. The release technology utilizes a water-loving polymer component to pull water into the fiber during washing. This allows ground-in stains, including oil, mud and ring around the collar, to be released more easily during laundering.

Quality and Durability Standards

All DuPont™ Teflon® fabric protector products must pass stringent brand assurance criteria. These are outlined in the *DuPont Global Specifications and Quality Control Tests for Fabrics Treated with Teflon® fabric protector*. DuPont is an industry leader in brand assurance, with thousands of samples tested annually in order to carry the Teflon® brand.

Ideal Uses

Perfect for shirts, knit tops, workwear, socks, underwear, and both washable and nonwashable home textiles.

Protects fabrics by repelling liquid spills and releasing ground-in stains during laundering.

Untreated fabrics allow stains to permanently penetrate the fabric, ruining their appearance.

The miracles of science™
