

Jan 13, 2010

I contacted **Fresh Hangers** recently for a product review and they agreed. I received a package of 5 Fresh Hangers. So I opened the package and there were 5 Fresh Hangers, which fit any size hanger. I put them on 5 hangers that I hung my husband's flannel shirts on because he is a smoker and I was curious to see if it too away the smoke smell. When I went back about 4 1/2 hours later I couldn't smell any smoke. None. It was actually amazing because I wasn't really sure about them. They come in packs of 5-\$14.99, 10-\$27.99 or 20-\$49.99. You can purchase them **here**: Like I said I received the 5 pack and I have used all 5 and my closet smells really fresh. Not like stale smoke.

Here is some information from the website:

**FRESHhanger is able to deodorize clothing through the power of Activated Carbon.**

Activated Carbon is scientifically proven to effectively absorb and eliminate odors due to its naturally highly porous structure. **FRESHhanger** harnesses this amazing technology to effectively deodorize clothing. **What is Activated Carbon?** Activated carbon has a random, imperfect structure which is highly porous over a broad range of pore sizes - from visible cracks and crevices to molecular dimensions. This structure gives carbon its very large surface area which allows carbon to absorb a wide range of compounds. Activated carbon has the strongest physical absorption forces and the highest volume of absorbing porosity of any material known to mankind. Activated carbon can have a surface of greater than 1000m/g. This means 3g of activated carbon can have the surface area of a football field!

**How does Activated Carbon deodorize clothing?** When a material absorbs something, it attaches to it by chemical attraction. The huge surface area of activated carbon gives it countless bonding sites. When certain chemicals pass next to the carbon surface, they attach to the surface and are trapped. Activated carbon is good at trapping other carbon-based impurities ("organic" chemicals), as well as things like chlorine. Once all of the bonding sites are filled, an activated charcoal filter stops working. At that point you must replace the filter. It is used primarily for purifying gases by absorption, solvent recovery, or deodorization and as an antidote to certain poisons.
